

Operators panel

TBD

Backup battery

There is a backup battery in the operators panel that retains some settings while the robot is powered off. It is charged while the robot is powered on and discharges a little every time the robot is turned off. It can retain the settings for up to a year, assuming normal use.

The settings that are retained are: homing, parking positions, clock settings and notification settings.

Storage of programs, locations and recipes does not rely on this battery.
